

Amendments to the Specification:

Please insert the following new paragraph after page 4, line 15.

In another aspect of the present invention, a controller enables wireless communication between an operation member and a host, where the operation member comprises, a transmission mechanism, an input mechanism, a display member that displays an input portion of said input mechanism and a control section. The input portion includes input items, the display of one of the input portion and at least one input item being changeable, with the display member being overlaid on the input mechanism. A control section generates a transmission signal corresponding to a display of the display member when the input mechanism is operated. The display member is a display panel having display contents that are switched by the operation member, and one of the input portions and at least one input items displayed on the display panel are switched in accordance with a switching signal supplied from the host to said operation member.
